

# Polycule

**People**  
For 2-6 players

**Material**  
Board with 199 hexagonal cells  
65 pieces (each 13 in five different colours)  
1 bag

**2015 developed und previously unreleased !**

**Exclusively at SMART COOKIE GAMES !**

**A long-chain molecule game! Who builds the longest molecular chains gets the most points. But be careful: Not dock at your own color and just do not give the other players new targets.**

The game is played on a board of 199 hexagonal fields. A molecule token of each color comes on a key field. All other game pieces remain in the bag. Two molecules remain on each player's hand; the player may place one and take another from the bag. The piece must be applied to an already occupied space; however, not one of the same color. Points will be made if a molecule creates a new chain or extend an existing one. A chain is composed of three or more molecules that form a straight line in the same color. These are not allowed to not touch each other, but they may be arbitrarily far apart. The score for a chain is its total length from start to finish with all intermediate molecules or spaces included. The winner is the player who was able to collect the most points.
